... transfer it to an electronic device that then fails, there's a chance that you lose that data. In the first two of the scenarios listed, someone still needs to be doing the data recovery; in the third scenario, the recovery is automated. It is always recommended that you have a back-up of your data just in case. This is also recommended by the US National Institute of Standards and Technology. The National Institute of Standards and Technology (NIST) released the following: "Computer storage media are the most common causes of data loss in the United States. More than 1.7... million hard drives were sold in the United States in 2011, and most of these were used in computers. In 2011, computers were estimated to have 1.4... billion hard disk drives; the actual number is estimated to be more than 4... billion. Of these, 1.1... billion hard disk drives were sold, of which 7.5... billion were used in computer servers and desktop computers." "A 2012 report from the Commission on Data Protection and Innovation (CDPI) showed that 40% of computer users in the United States had lost at least one computer hard drive since buying it, and that a substantial percentage of hard drives are not backed up." "Despite the availability of multiple types of data storage systems, nearly 60% of respondents reported that they currently have no system to back up their data." Deleted files There are many ways to recover deleted files on a hard disk drive, and they all have their advantages and disadvantages. Different people have different reasons for losing data. Some lost data because they didn't back up their data on their computer. Others may be tempted to delete something they wish they had saved. This is where the process of recovering deleted files on a hard drive can come in useful. Depending on how recent the data is, there are some things that can be done. If you deleted a file recently, you may not have deleted it completely. The file may still be on the hard drive in an active state. This means that you can still use your hard drive and retrieve the deleted file back into your computer. If your deleted files were deleted less than 60 days ago, you should use a special file recovery tool to see 82157476af
